

I'm not robot!

Given a Hexadecimal number as an input, the task is to convert that number to a Binary number. Examples: Input: Hexadecimal = 1AC5 Output: Binary = 0001101011000101 Explanation: Equivalent binary value of 1: 0001 Equivalent binary value of A: 1010 Equivalent binary value of C: 1100 Equivalent binary value of 5: 0101 Input: Hexadecimal = 5D1F Output: Binary = 0101110100011111 Approach: A hexadecimal number is a positional numeral system with a radix, or base, of 16 and uses sixteen distinct symbols. A binary number is a number expressed in the base-2 binary numeral system, which uses only two symbols; which are 0 (zero) and 1 (one). To convert Hexadecimal number to Binary, the binary equivalent of each digit of the Hexadecimal number is evaluated and combined at the end to get the equivalent binary number. #include <string> using namespace std; void HexToBin(string hexdec) { long int i = 0; while (hexdec[i]) { switch (hexdec[i]) { case '0': cout
